Chapter 16 Event-Driven Programming

- ❖ Sections 1 7: Events and Source, Class Listeners, Registering Listeners and Handling Events, Inner Classes, JButton and JTextField Sources
- Create a GUI program that lets the user enter numerical data process it and displays results
- What is required to accomplish the task?
 - ♦ What comes first the GUI design or event coding?
 - What Java class objects that need to be used?
 - ♦ How do you know if program works?
- Procedural vs. Event-Driven Programming
 - Procedural programming is executed in procedural order
 - Event-driven programming, code is executed upon activation of events.

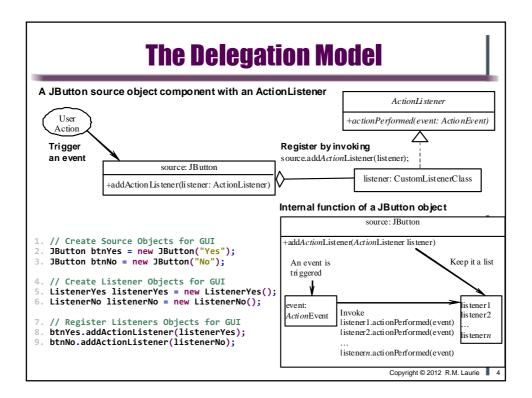

Selected User Actions

Event source object contains whatever properties are pertinent to the event. You can identify the source object of the event using the getSource() instance method in the EventObject deal with special types of events, such as button actions, window events, component events, mouse movements, and keystrokes.

Table 15.1 lists external user actions, source objects, and generated events

User Action	Source Object	Event Type Generated
Click a button	JButton	ActionEvent
Click a check box	JCheckBox	ItemEvent, ActionEvent
Click a radio button	JRadioButton	ItemEvent, ActionEvent
Press return on a text field	JTextField	ActionEvent
Select a new item	JComboBox	ItemEvent, ActionEvent
Window opened, closed, etc.	Window	WindowEvent
Mouse pressed, released, etc.	Component	MouseEvent
Key released, pressed, etc.	Component	KeyEvent

java.awt.event.ActionEvent Event object contains information about event • event.getSounce() returns the source object ◆ event.getWhen() returns time event occured java.util.EventObject +getSource(): Object Returns the object on which the event initially occurred. java.awt.event.AWTEvent java.awt.event.ActionEvent Returns the command string associated with this action. For a +getActionCommand(): String button, its text is the command string. +getModifiers(): int Returns the modifier keys held down during this action event. +getWhen(): long Returns the timestamp when this event occurred. The time is the number of milliseconds since January 1, 1970, 00:00:00

GMT.

```

Anonymous Inner Classes

- An anonymous inner class must always extend a superclass or implement an interface, but it cannot have an explicit extends or implements clause
- An anonymous inner class must implement all the abstract methods in the superclass or in the interface
- An anonymous inner class always uses the no-arg constructor from its superclass to create an instance
- If an anonymous inner class implements an interface, the constructor is Object()
- An anonymous inner class is compiled into a class named OuterClassName\$n.class
 - Outer class <u>Test</u> has two anonymous inner classes, these two classes are compiled into Test\$1.class and Test\$2.class
- Inner class listeners can be shortened
 - ♦ An anonymous inner class is an inner class without a name
 - It combines declaring an inner class and creating an instance of the class in one step

                                                                                                                                                                                                                              I hate it, because way too complicate
                            fraWindow.setVisible(true);
                                                                                                                                                                                                                                             Yes No
```

Alternative Way of Defining Listener Classes

- Create Common Listener & Detect Source
 - ◆ Register one listener with several buttons
 - ◆Let the listener detect the event source, that is which button fires the event
- You may also define the custom frame class that implements ActionListener
 - ◆Frame extends JFrame and implements ActionListener
 - Class is listener class for action events
 - ◆Not prefered because too much in one class
 - ◆Described in Listing 16.5

Copyright © 2012 R.M. Laurie 13

```
Create Common Listener & Detect Source
       import javax.swing.*;
      import java.awt.event.*;
public class LikeJavaAlt1 extends JFrame {
    JButton btnNo = new JButton("Yes");
    JLabel lblQuestion = new JLabel("Do you like to do GUI programming?");
    public LikeJavaAlt1() {
             JPanel panMain = new JPanel();
                                                                                                       🔏 Java GUI Program... 🕒 😐 🗪
9.
10.
             panMain.add(lblQuestion);
                                                                                                         Do you like to do GUI programming?
             panMain.add(btnYes);
                                                                                                                Yes No
             panMain.add(btnNo);
12.
13.
             add(panMain); // Add panel to frame
AllButtonsListener listenerButtons = new AllButtonsListener();
14.
15.
16.
17.
18.
             btnYes.addActionListener(listenerButtons);
             btnNo.addActionListener(listenerButtons);
          class AllButtonsListener implements ActionListener {
             public void actionPerformed(ActionEvent theButtonEvent) {
  if(theButtonEvent.getSource() == btnYes)
